

MICROCHIP

AY0438

32-Segment CMOS LCD Driver

FEATURES

- Drives up to 32 LCD segments of arbitrary configuration
- CMOS process for: wide supply voltage range, low- power operation, high-noise immunity, wide temperature range
- CMOS and TTL-compatible inputs
- Electrostatic discharge protection on all pins
- Cascadable
- On-chip oscillator
- Requires only three control lines

APPLICATIONS

- Industrial displays
- Consumer product displays
- Telecom product displays
- Automotive dashboard displays

DESCRIPTION

The AY0438 is a CMOS integrated device that drives a liquid crystal display, usually under microprocessor control. The part acts as a smart peripheral that drives up to 32 LCD segments. It needs only three control lines due to its serial input construction. It latches the data to be displayed and relieves the microprocessor from the task of generating the required waveforms.

The AY0438 can drive any standard or custom parallel drive LCD display, whether it be field effect or dynamic scattering; 7-, 9-, 14- or 16-segment characters; decimals; leading + or -; or special symbols. Several AY0438 devices can be cascaded. The AC frequency of the LCD waveforms can either be supplied by the user or generated by attaching a capacitor to the LCD input, which controls the frequency of an internal oscillator.

The AY0438 is available in 40-lead dual in-line plastic and 44-lead PLCC packages. Unpackaged dice are also available.

PIN CONFIGURATION

FIGURE 1: PIN DESCRIPTIONS

Pin # (PDIP Only)	Name	Direction	Description
1	VDD	-	Supply voltage
2	Load	Input	Latch data from registers
3-29, 32, 33, 37-39	Seg 1-32	Output	Direct drive outputs
30	BP	Output	Backplane drive output
31	LCDΦ	Input	Backplane drive input
34	Data In	Input	Data input to shift register
35	Data Out	Output	Data output from shift register
36	VSS	Ground	Ground
40	Clock	Input	System clock input

FIGURE 2: BLOCK DIAGRAM

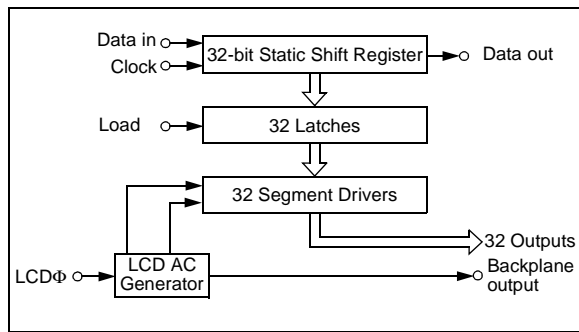

FIGURE 3: BACKPLANE AND SEGMENT OUTPUT

FIGURE 4: TIMING DIAGRAM

1.0 OPERATION:

1.1 Data In and Clock

The shift register shifts and outputs on the falling edge of the clock. Every clock falling edge does a logical left shift. As an example, if 32 clock pulses are supplied as in Figure 4, then the data input at the first clock will output at SEG 32, and the last data input (# 32) will output at SEG 1 when a LOAD signal is enabled (Figure 2). It is recommended that a complete 32 bit transfer be done every time the outputs are updated. A logic 1 at the Data In causes the corresponding segment to be

enabled or visible, i.e. the output at Segment Output is 180° out-of-phase with the Backplane output (Figure 3).

1.2 Load

A logic 1 at the Load input (Figure 2) causes the parallel load of the data in the shift register into the latches that control the segment drivers. If the Load signal is tied high, then the latches become transparent and the segment drivers are always connected to the shift registers.

1.3 LCD ϕ

LCD ϕ can be driven by an external signal or by connecting a capacitor between LCD ϕ and ground (GND), which will enable the on-chip oscillator required to generate the backplane output voltage. Figure 5 shows the relationship between capacitance value and output frequency. Leaving the LCD ϕ input unconnected is not recommended. When driven by an external clock, the backplane output is in phase with the input clock. When cascading two AY0438 devices (Figure 6 and Figure 7), the backplane output can be generated using a capacitor to GND on the first AY0438. This backplane output can then be connected to the LCD ϕ input of the second AY0438. The backplane output of the second device is then used to drive the backplane of the LCD module.

AY0438

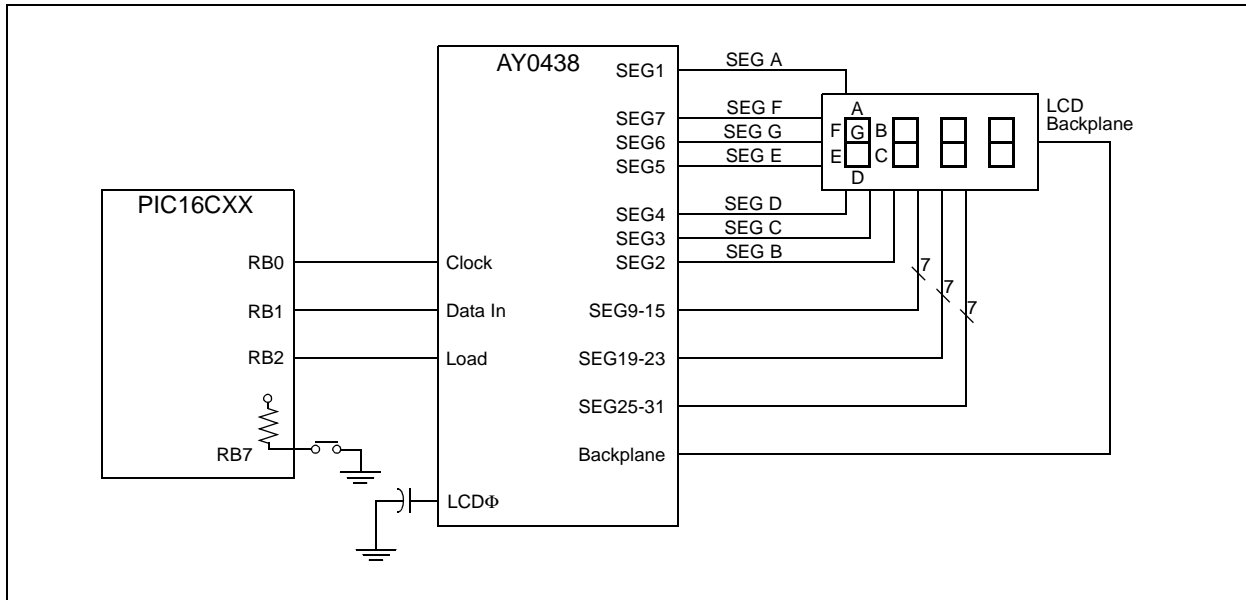

1.4 General

In order to avoid any race conditions, the Data In and Load signals should not be changed during a falling edge of the Clock. Figure 4 and Figure 7 show a typical timing diagram for a 32 segment and 64 segment LCD module.

1.5 Interfacing to a LCD Module and PIC16CXX Device

Figure 8 shows a typical layout of an AY0438 connected to a LCD module and interfaced to a PIC16CXX family device. Example 1 lists code used to program the PIC16CXX device. This code was compiled using MPASM.

FIGURE 8: INTERFACING TO A LCD MODULE AND PIC16CXX DEVICE

EXAMPLE 1: EXAMPLE CODE

```

;*****
;This program shows an interface between a PIC16CXX device
;and the AY0438 LCD controller to control a 7 Segment
;4 digit LCD module.
;The PIC16CXX interface to the AY0438 Hardware:
;
;   PORTB bit 0 --> CLK
;   PORTB bit 1 --> DATA IN
;   PORTB bit 2 --> LOAD
;
;The LCD module is connected to the AY0438 as follows:
;   Most Significant digit --> seg1 to seg7
;   3rd Significant digit  --> seg9 to seg15
;   2nd Significant digit  --> seg17 to seg 23
;   Least Significant digit --> seg25 to seg 31
;

```

```

;The DP are not connected, but can be connected to seg8, 16, 24 & 32.
;For each digit, the segments are connected as:
;   Seg A --> seg(8*n + 1)
;   Seg B --> seg(8*n + 2)
;   Seg C --> seg(8*n + 3)
;   Seg D --> seg(8*n + 4)
;   Seg E --> seg(8*n + 5)
;   Seg F --> seg(8*n + 6)
;   Seg G --> seg(8*n + 7)
;where n = 0, 1, 2 and 3 for MSD, 3rdSD, 2ndSD and LSD respectively.
;The firmware uses the values in registers:
;   MSD, THRDSD, SCNDSD and LSD   to determine the values to be
;pulsed to the AY0438.
;In this example, a pushbutton connected to PORTB bit 7
;is checked periodically to see if it has been pressed. If so,
;the LCD values in locations MSD to LSD are updated.

NOTES:

AY0438

AY0438 Product Identification System

To order or to obtain information, e.g., on pricing or delivery, please use the listed part numbers, and refer to the factory or the listed sales offices.

Sales and Support

Products supported by a preliminary Data Sheet may possibly have an errata sheet describing minor operational differences and recommended workarounds. To determine if an errata sheet exists for a particular device, please contact one of the following:

1. Your local Microchip sales office.
2. The Microchip Corporate Literature Center U.S. FAX: (602) 786-7277
3. The Microchip's Bulletin Board, via your local CompuServe number (CompuServe membership NOT required).

Please specify which device, revision of silicon and Data Sheet (include Literature #) you are using.

For latest version information and upgrade kits for Microchip Development Tools, please call 1-800-755-2345 or 1-602-786-7302.
