**QUAD PROGRAMMABLE OPERATIONAL AMPLIFIER  
QUAD PROGRAMMABLE COMPARATOR  
PROGRAMMABLE DUAL OP AMP/DUAL COMPARATOR**

The MC14573, MC14574, and MC14575 are a family of quad operational low power amplifiers and comparators using the complementary P-channel and N-channel enhancement MOS devices in a single monolithic structure. The operating current is externally programmed with a resistor to provide a choice in the tradeoff of power dissipation and slew rates. The operational amplifiers are internally compensated.

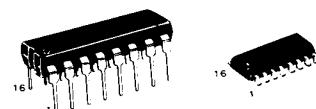

These low cost units are excellent building blocks for consumer, industrial, automotive and instrument applications. Active filters, voltage reference, function generators, oscillators, limit set alarms, TTL-to-CMOS or CMOS-to-CMOS up converters, A-to-D converters and zero crossing detectors are some applications. These units are useful in both battery and line operated systems.

- Operating Temperature Range: -40 to 85°C
- Power Supply — Single 3.0 to 15 V  
Dual  $\pm 1.5$  to  $\pm 7.5$  V
- Wide Input Voltage Range
- Common Mode Range 0.0 to V<sub>DD</sub> — 2.0 V for Single Supply
- Externally Programmable Power Consumption with One or Two Resistors
- Internally Compensated Operational Amplifiers
- High Input Impedance
- Comparators — JEDEC B-Series Compatible
- Chip Complexities: MC14573 — 30 FETs  
MC14574 — 46 FETs  
MC14575 — 38 FETs

## MAXIMUM RATINGS<sup>t</sup> (Voltages referenced to V<sub>SS</sub>)

Rating	Symbol	Value	Unit
DC Supply Voltage	V <sub>DD</sub>	-0.5 to +18	V
Input Voltage, All Inputs	V <sub>in</sub>	-0.5 to V <sub>DD</sub> + 0.5	V
DC Input Current, per Pin	I <sub>in</sub>	±10	mA
Programming Current Range	I <sub>Set</sub>	2	mA
Operating Temperature Range	T <sub>A</sub>	-40 to +85	°C
Storage Temperature Range	T <sub>Stg</sub>	-65 to +150	°C
Package Power Dissipation*	P <sub>D</sub>	800	mW

\*Derate above 25°C @ 4.6 mW/°C

<sup>t</sup>Maximum Ratings are those values beyond which damage to the device may occur.

This device contains circuitry to protect the inputs against damage due to high static voltages or electric fields; however, it is advised that normal precautions be taken to avoid application of any voltage higher than maximum rated voltages to this high impedance circuit. For proper operation it is recommended that V<sub>in</sub> and V<sub>out</sub> be constrained to the range V<sub>SS</sub> ≤ (V<sub>in</sub> or V<sub>out</sub>) ≤ V<sub>DD</sub>

## RECOMMENDED OPERATING RANGE

Rating	Symbol	Value	Unit
DC Supply Voltage	V <sub>DD</sub> to V <sub>SS</sub>	+3.0 to +15	V

#Data labelled "Typ" is not to be used for design purposes but is intended as an indication of the IC's potential performance.

# MC14573•MC14574•MC14575

The programming current  $I_{Set}$  is fixed by an external resistor  $R_{Set}$  connected between  $V_{SS}$  and either one or both of the  $I_{Set}$  pins (8 and 9). When two external programming resistors are used, the set currents for each op amp pair or comparator are given by:

$$I_{Set} (\mu A) = \frac{V_{DD} - V_{SS} - 1.5}{R_{Set} (M\Omega)}$$

Pins 8 and 9 may be tied together for use with a single programming resistor. The set currents for each op amp pair or comparator pair are then given by:

$$I_{Set\ A,\ B} = I_{Set\ C,\ D} (\mu A) \approx \frac{V_{DD} - V_{SS} - 1.5}{2 R_{Set} (M\Omega)}$$

The total device current is typically 13 times  $I_{Set}$  per pair if the outputs are in the low state, and 5 times  $I_{Set}$  per pair if the outputs are in the high state. For op amps with an output in the linear region the device current will be between the values of 5 times and 13 times  $I_{Set}$ .

If a pair of op amps is not used, the  $I_{Set}$  pin for that pair may be tied to  $V_{DD}$  for minimum power consumption. To minimize power consumption in an unused pair of comparators this is not effective. The comparators should use a high value set resistor and the inputs should be set to a voltage that will force the output to  $V_{DD}$  (i.e.,  $+in = V_{DD}$ ,  $-in = V_{SS}$ ).

It should be noted that increasing  $I_{Set}$  for comparators will decrease propagation delay for that comparator.

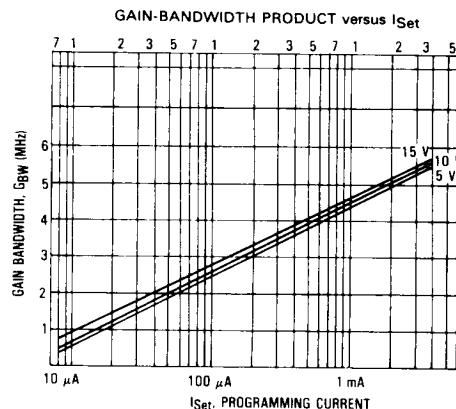

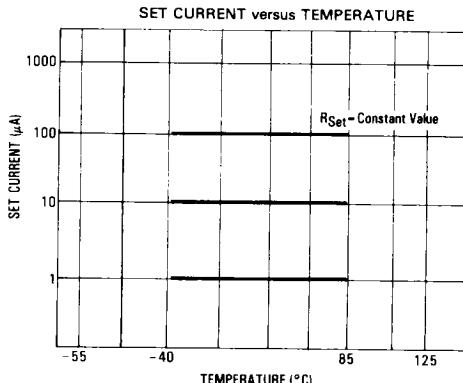

For operational amplifiers, the maximum obtainable output voltage ( $V_{OH}$ ) for a given load resistor connected to  $V_{SS}$  is given by:

$$V_{OH} = 4 \times I_{Set} \times R_L - 0.05 \text{ V}, R_L \text{ in } \Omega, I_{Set} \text{ in A}$$

Note:  $V_{OH} \text{ Max} = V_{DD}$

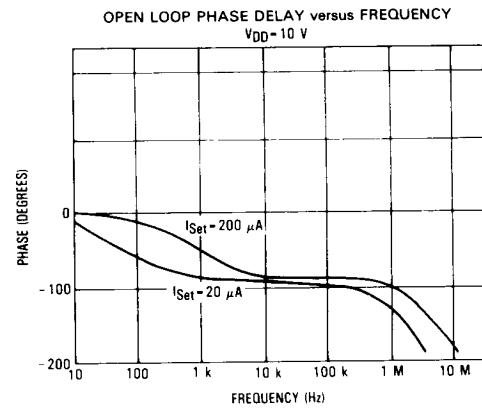

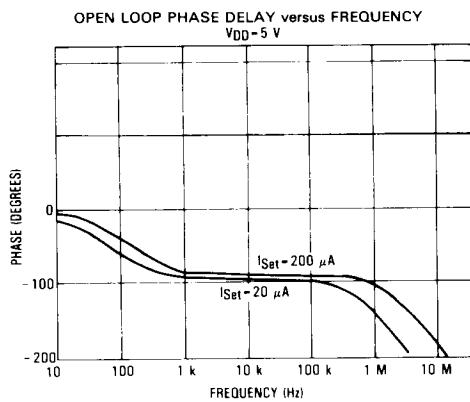

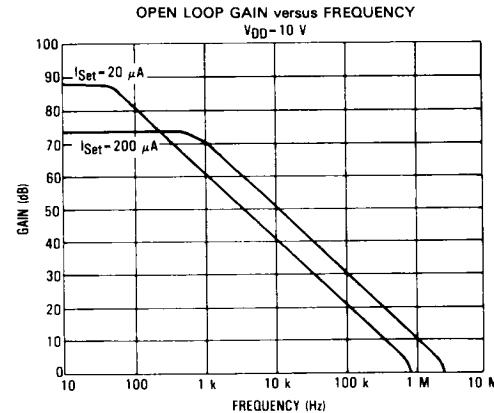

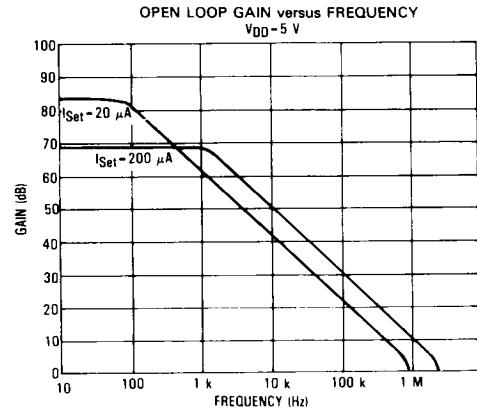

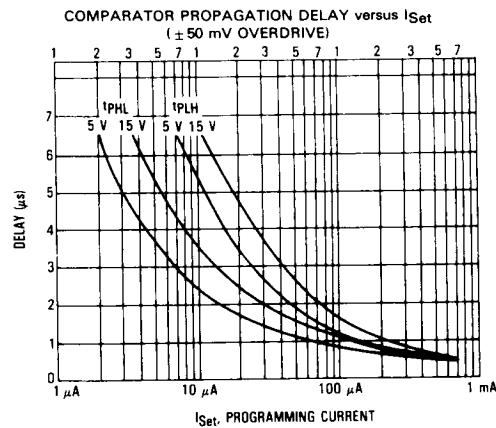

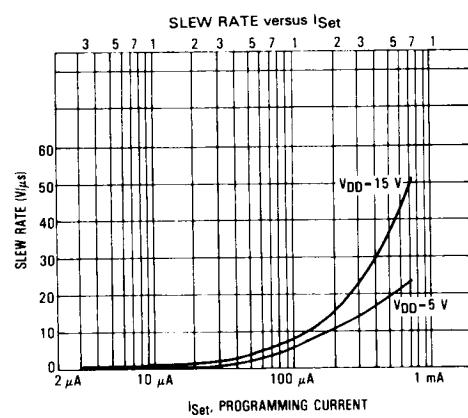

Typical op amp slew rates are given by:

$$S_R \approx 0.04 I_{Set} (\text{V}/\mu\text{s}), I_{Set} \text{ in } \mu\text{A}$$
