NEGATIVE ADJUSTABLE VOLTAGE REGULATOR
General Description

The LM137K is an adjustable 3-terminal negative voltage regulator capable of supplying in excess of -1.5A over an output voltage range of -1.2V to -37V. This regulator is exceptionally easy to apply, requiring only 2 external resistors to set the output voltage and 1 output capacitor for frequency compensation. The circuit design has been optimized for excellent regulation and low thermal transients. Further, the LM137K features internal current limiting, thermal shutdown, and safe-area compensation, making it virtually blow-out proof against overloads.

The LM137K serves a wide variety of applications including local on-card regulation, programmable-output voltage regulation or precision current regulation. The LM137K is an ideal complement to the LM117K adjustable positive regulator.

Features

- Output voltage adjustable from -1.2V to -37V.
- 1.5A output current guaranteed, -55 C to +150 C.
- Line regulation typically 0.01%/V.
- Load regulation typically 0.3%.
- Excellent thermal regulation, 0.002%/W.
- 77 dB ripple rejection.
- Excellent rejection of thermal transients.
- 50 ppm/ C temperature coefficient.
- Temperature-independent current limit.
- Internal thermal overload protection.
- Standard 3-lead transistor package.
- Output is short circuit protected.

Note 1: Absolute Maximum Ratings indicate limits beyond which damage to the device may occur. Operating Ratings indicate conditions for which the device is functional, but do not guarantee specific performance limits. For guaranteed specifications and test conditions, see the Electrical Characteristics. The guaranteed specifications apply only for the test conditions listed. Some performance characteristics may degrade when the device is not operated under the listed test conditions.

Note 2: The maximum power dissipation must be derated at elevated temperatures and is dictated by T_{jmax} (maximum junction temperature), θ_{JA} (package junction to ambient thermal resistance), and T_A (ambient temperature). The maximum allowable power dissipation at any temperature is $P_{dmax} = (T_{jmax} - T_A)/\theta_{JA}$ or the number given in the Absolute Maximum Ratings, whichever is lower.
